FDP DAY 5 · 06 NOV 2026

Agents that plan

Introduction to AI agents and intelligent workflows

SATYA K - @SriSatyaLokesh

Visit this to know more about me

FROM LAST NIGHT

Did you try it?

TYPE IN THE CHAT

1. I rebuilt my form with the UI/UX skill
2. I made an interactive deck in Antigravity
3. I tried, and something broke

What surprised you? What broke?

YESTERDAY

Vibe coding

Describe it; the agent builds it; you test it.

↓

TONIGHT

Agentic coding

Plan first; agents build, test and check: building real products with agentic AI.

YOUR QUESTION FROM YESTERDAY

Speak in your own language

Claude and Gemini understand Telugu, Hindi, Tamil, English, and a mix of them.

తెలుగు | हिन्दी | தமிழ் | English | Telugu + English

Type it

In Telugu script, or Telugu typed in English letters. Both work.

Say it

Turn on voice mode in the Claude or Gemini app, and just speak, clearly.

Mix it

Telugu and English in the same sentence is fine.

TIP Before it starts, ask: *"First tell me in English what you understood."* Then correct it if needed.

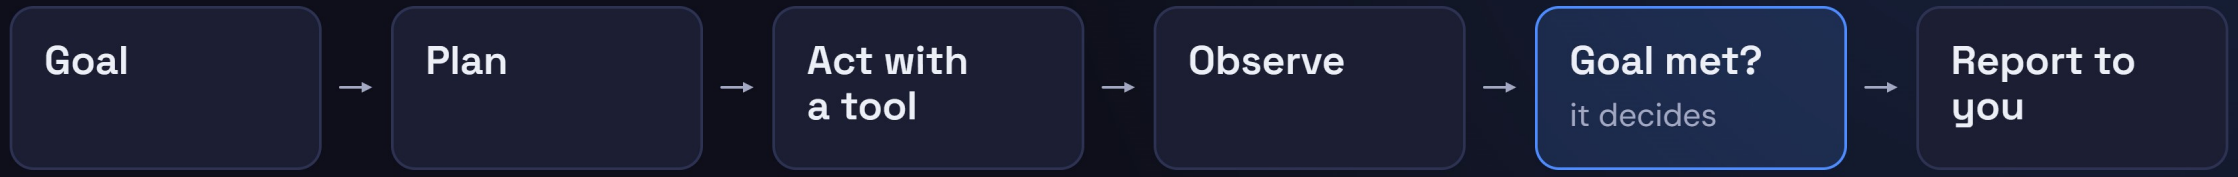

TONIGHT IN ONE LINE

Plan first.
Let them work.
Then verify.

Everything tonight is one of these three.

HOW AN AGENT WORKS

Every agent runs the same loop

The agent decides for itself when it is done. Everything tonight exists to check that decision.

HOW AN AGENT WORKS

Tools are the agent’s hands

```
MODEL      “call read_file with path = notes.md”
HARNESS    runs it, hands back the text
MODEL      reads it, decides the next step
```

MCP: one plug, many apps

GitHub · Google Drive · databases · browsers

Every tool is a permission

Connect only what the job needs.

HOW AN AGENT WORKS

What a good plan holds

01 Steps small enough to check one at a time

02 The order, and what depends on what

03 How each step will be verified

04 What the agent will not touch

Teach it without AI too: students write the plan before they prompt, then compare it with the agent's.

THE FAST WAY

Vibe coding

“make it nice”

2 minutes later: it works!

3 hours later: still fixing it

THE FAST WAY, REALLY

Spec first

20 minutes writing what “done” means

40 minutes later: it works

and you know why

SPEC KIT, PART 1

Three files, written once per project

constitution.md

The rules every feature follows

mission.md

What we build, for whom, and why

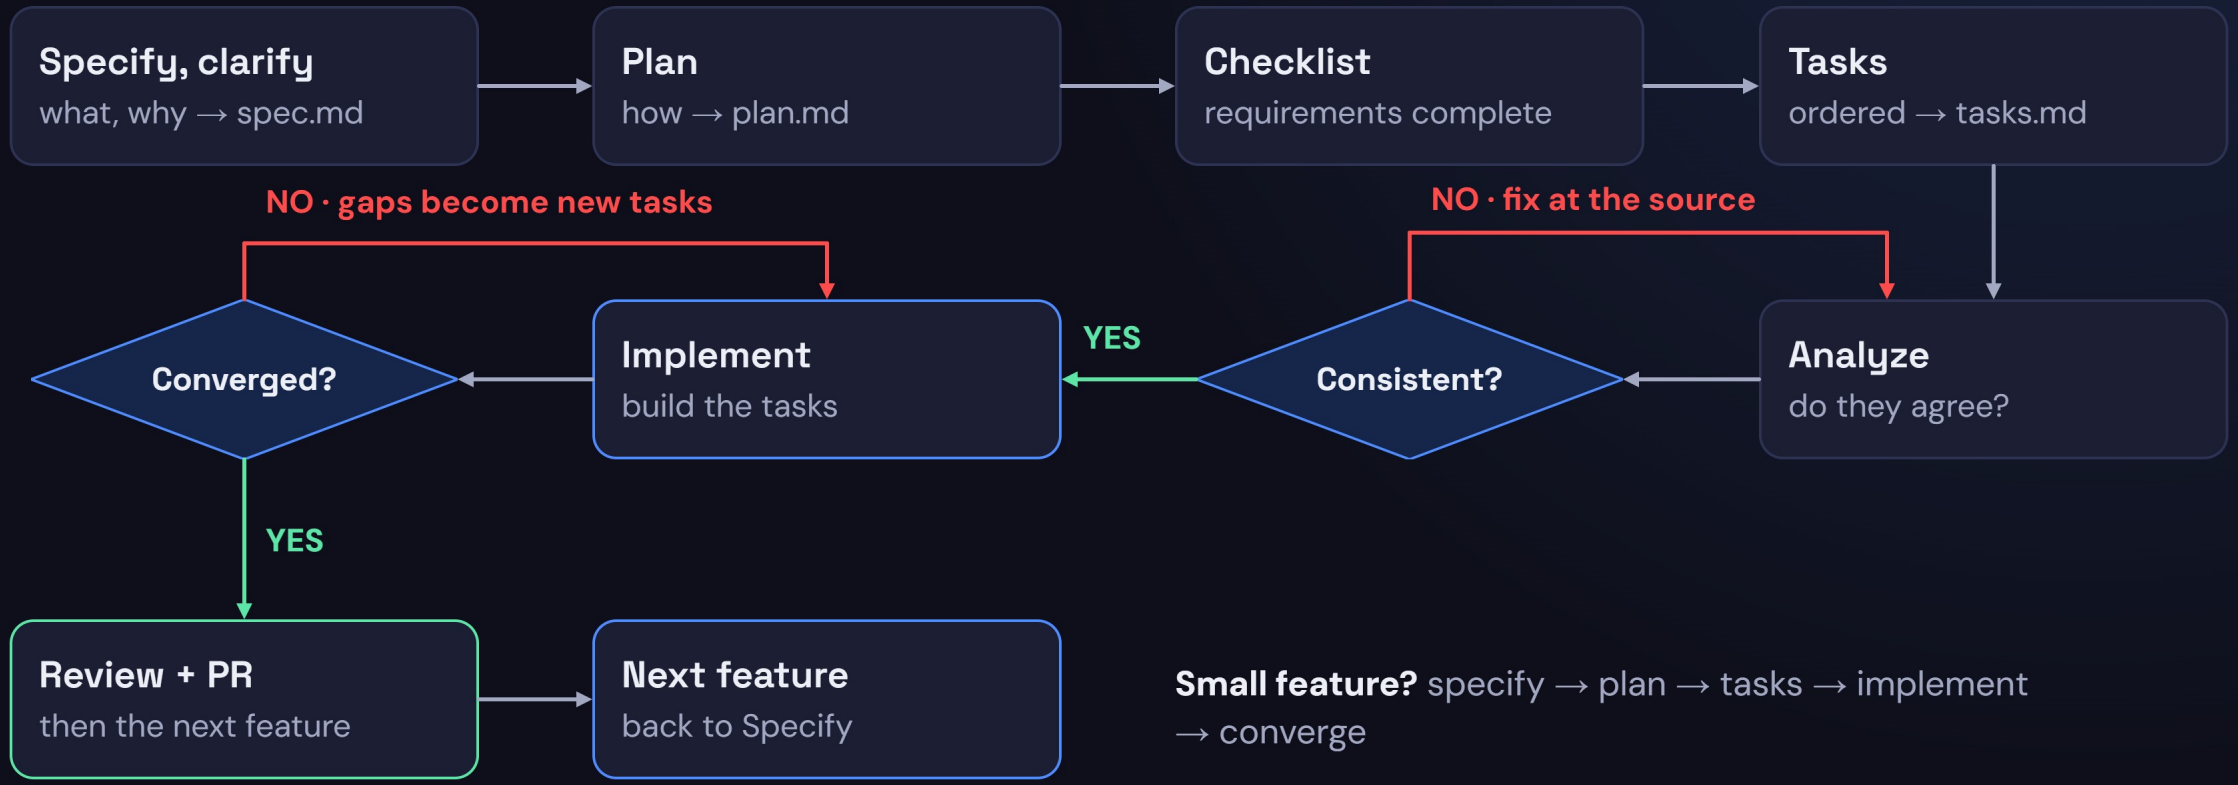

tech-stack.md

The tools and architecture we build with

Every feature reads all three

SPEC KIT, PART 2

The loop for every feature

Small feature? specify → plan → tasks → implement → converge

How Superpowers builds something

DEMO

Blog post generation

MANY AGENTS AT ONCE

SPAWNING AGENTS

Subagents or parallel agents?

SUBAGENTS: INSIDE ONE TASK

Main agent

helper | **helper** | **helper**

Each starts fresh; results come back to the main agent.

PARALLEL AGENTS: SIDE BY SIDE

agent A | **agent B** | **agent C**

folder A | **folder B** | **folder C**

Each in its own workspace; you visit each in turn.

One agent per folder. You review every result.

BUILD AN LLM WIKI

What an LLM wiki is

RAW SOURCES

- **Links**
- **Blog posts**
- **PDFs**
- **Your notes**

→

THE AGENT

INGEST
reads a new source; updates every page it touches

QUERY
answers from the wiki; files good answers back

LINT
finds contradictions and gaps; searches the web to fill them

→

THE WIKI: YOURS, PLAIN TEXT

index.md · what is where

Concept pages, linked to each other

Every claim cites its source

log.md · what changed, and when

A schema file (CLAUDE.md or AGENTS.md) tells the agent how the wiki is organised.

BUILD AN LLM WIKI

Tonight’s path to a working wiki

The idea
Karpathy’s gist

→

Requirements document
what it must do; what “done” means

→

Superpowers builds it
brainstorm, plan, build, test, verify

→

Add sources
a link, a post, a file

→

Use it
ask; open a cited source; add more

A spec first, then an agent builds from it: Spec Kit’s idea and Superpowers’ method on one real project.

DEMO

Build the LLM wiki

COMING TOMORROW · DAY 6

We build a Class Prep Studio

IN

- a topic
- your textbook chapter
- your syllabus unit

OUT

- a lesson plan
- class slides
- important questions, with answers
- a practice quiz
- a student handout with diagrams

Tomorrow we build it live, together: research agents, a debate, four builders at once, and you at the gates.

DEMO

Video generation and slide generation

CLOSE

What we just saw

Plan first	A spec, a requirements document, a reviewed plan
One job per agent	Superpowers' subagents, one task each
You verify	Tests, reviews, a cited source opened

FOR THE NEXT CLASS

Design your own orchestration

01 Study Superpowers: install it, and read how its skills work together.

02 Design an orchestration for one real task: which agents, what each one does, where you review.

03 Let it run to the end, then review the final outcome. Bring what you learned to Day 6.

Also: the free Spec Kit course on DeepLearning.AI (link in the chat).

05

Thank you

Plan first. Let them work. Then verify.

SEE YOU TOMORROW · DAY 6
